

Stars-bias sign-flip diagnosis (CV vs SB35)

VERDICT

H1 (param-dep correction) : strong support
3 / 35 params significant @ $p<0.05$;
SB35 sim-to-sim STD = 0.30 in
truth/gen (massive spread).

H2 (halo-mass shift) : ruled out
median $\log_{10} M_h \approx 13.28$ for CV
and SB35. Within each M_h bin
CV stays at ~ -0.09 and SB35
stays at $\sim +0.19$; flip is
NOT driven by halo population.

H3 (feedback under-tracking): mixed
p4 RadioFB, p6 RadioFBreorient:
amp[1] (under-tracked).
p5 VariableWindVel: amp=2.4
(over-tracked). Per-variant
1P ratio swings from 0.55 to 1.53
depending on astro params.
